

Table 1. Number of journals offering various levels of endorsement for six “hotly debated” statistical topics.

Topic	Explicit endorsement	Implicit endorsement	Implicit opposition	Explicit opposition
Confidence intervals	85	4	1 [#]	0
Sample size planning/ justification	67	5	0	0
Effect sizes	62	4	0	0
<i>p</i> -values	10	77	0	1 [*]
Statistical significance	9	35	5	3
Bayesian statistics	0	39	0	0

Explicit endorsement = the journal advises or instructs authors to use this method whenever possible/appropriate. Implicit endorsement = the journal provides advice on the method, implying endorsement, but does not explicitly advise that the method should be used. Implicit opposition = the journal advises that they would prefer the method is not used, but does not explicitly rule it out. Explicit opposition = the journal advises that the method should not be used.

NOTE: Some opposition was caveated as indicated by the symbols below.

[#]Confidence intervals are implicitly opposed by this journal only in the context of small sample sizes.

^{*}*p*-values are opposed by this journal only when there were no prespecified multiplicity corrections.
